

Lab: Adding Relationships

3 min to complete · By Brandon Gigous

If you have not already [cloned the Python Flask labs project](#), and got it open in VS Code, please do so before proceeding with this lab.

Learn by Doing

1. Navigate to the labs project and open it in VS Code.
2. Complete all the exercises in the [01_adding_a_relationship folder](#).
3. If you're subscribed to our [membership](#) or [mentorship](#) programs, please feel free reach out on [Discord](#) for a review or any help!
4. When you complete the labs, please be sure to push your work to GitHub. This step is easily and often overlooked, but it is one of the **most important**. Version control and collaboration tools, most notably Git & GitHub, are used ubiquitously by all software engineers and engineering companies. Prove your work. Push it to GitHub. Get the practice, and get those GitHub Greens!

Hey there, before you move on. Did you run, review, and complete the lab? Did you push your work to GitHub? If the answer to either of these questions is "no" then you're at risk of cutting corners and skipping critical steps. Completion of the labs is required for receiving a course certificate, and required to prove your work! Practice these skills as you go, and by the end you'll be a pro.
